

Expro can provide portable inline vaporizers from 250,000 to 1,500,000 BTU/hr with 2" inlet/outlet. These systems can be used to safely vaporize liquid products. Most commonly used in commissioning projects to either vaporize heavy products to gas to prevent nitrogen bubbles remaining in the product stream or to increase temperature of light products so it remains above the safe pipe metal temperature as it is introduced into the pipeline.
